Impact On Current Careers

As AI continues to become more capable, many high school and university students are concerned about the job market and how to prepare for their futures. This dashboard aims to explain and alleviate stress by exploring an AI Career Threat Index dataset to uncover AI-resistant jobs. This dataset covers 76 jobs across 10 categories and has been creating risk scores for the last 4 fiscal quarters. The risk score is calculated by selecting representative tasks, mapping them against current AI capabilities, and weighting them by the industry adoption rate for each job.

Which Industries Are The Most Impacted By AI?

How did Risk Scores Change From 2025 to 2026? (Hover to Inspect)

Marketing & Sales

AI Risk Score Increased By 24%

-1.80
difference from the overall in 2025

-1.05
difference from the overall in 2026

Various industries show a clear trend towards a greater reliance on AI. Jobs in 2026 face 1.2 times the AI risk faced in 2025. AI adoption rate could explain the uniform increase in risk and help explain the inconsistencies in score increases.

AI Adoption is not the main reason for increased AI Risk!..

AI Adoption Rate is the percent of industry companies who have integrated at least one AI model
from https://prospin.ai/research/ai-adoption-by-industry

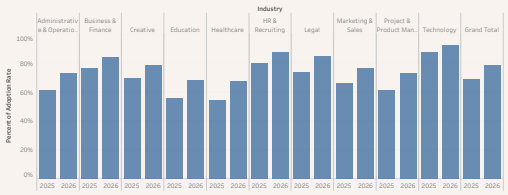

Marketing & Sales

Adoption Rate Increased By 15%

-2
Percentage points difference from the overall in 2025

-2
Percentage points difference from the overall in 2026

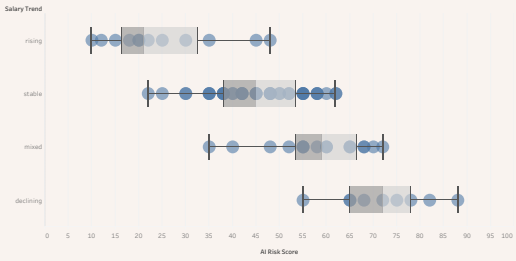

How did AI Adoption Change From 2025 to 2026? (Hover to Inspect)

The similar AI score increase across all industries can be explained by the 78% AI adoption rate in 2026 [1]. However, industries with the highest AI scores do not necessarily have the highest adoption rates, such as Technology or HR & Recruiting. This is already factored into the creation of the AI risk score so we cannot claim adoption rate is the differing factor. Within Technology, they may employ AI agents tasked with menial coding, which explains lower scores. The limited capabilities of deployed agents reduce scores. Research found that only 6% of models produce good results [2]. Are there financial incentives for companies to use more AI, and will this differentiate the industry AI scores?

If AI Does More of Your Job, Do Companies Pay You Less?

Does Correlation reveal a hidden relationship between Risk Score and Salary Trend?

Correlations

Overall: -0.78

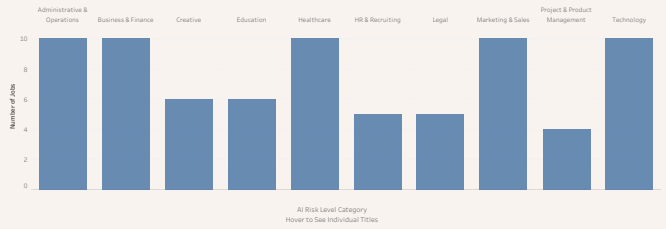

Healthcare: -0.94

Technology: -0.92

Jobs with a negative salary trend, where salary trend is wage growth, also see an increase in their AI risk score. There is an inherent relationship between salary trend, however, the correlation does not match the initial risk scores. Research indicates that entry-level roles receive a larger impact from AI than their senior roles [3]. If this is accurate, then jobs that require more advanced skills tend to resist AI and also pay more. The industries that we originally saw with lower scores have more jobs with less risk. Let's explore all industries and respective jobs to find those less vulnerable to AI linked to wage growth rather than stagnation or compression.

Which Industries Have Jobs with Less AI Risk?

What are the Job Titles at each Risk Level? (Click to Expand)

The two industries that stand out the most are Healthcare and Technology. They both have multiple occupations in low-risk and rising salary jobs.

In Healthcare, 8 of 10 jobs are low or moderate risk. This industry is more resistant to AI takeover due to ethical concerns and data privacy issues. AI trained at one hospital cannot be used in another hospital because it is trained to specific parameters. There are also hidden biases that AI could use to address medical conditions without looking at other options. Because of these biases in healthcare, there will be a growing need for professionals to oversee evolving healthcare AI.
In contrast, the Technology sector actively embraces AI, resulting in high levels of adoption. However, 7 of 10 jobs are low or moderate-risk due to limitations of AI. Currently, AI is only able to do basic tasks and still needs to be handled by humans, which is why jobs like AI engineers have a low risk and rising salary.

Takeaways

In 2026, there are jobs with rising salaries and lower AI risk, ranging from software engineer to physical therapist in industries like Product & Project Management to Healthcare. Industries have been highlighted to show the differences in AI risk, but with high adoption AI is everywhere you look.

Both Overall AI Risk Score and AI Adoption Rate sees increases from 2025 to 2026

Jobs with positive salary growth see less AI takeover

Technology and Healthcare are two promising industries, both with multiple lower risk jobs.

Here are some examples of how industries focus their AI use. The Healthcare industry looks to ensure the ethical and protected use of AI. The Technology industry is advancing rapidly, striving to harness AI's potential. The Business & Finance industry is using predictive analysis to forecast outcomes and speed up decision making. The Marketing & Sales industry is optimizing marketing campaigns and generating more actionable insights.
This raises the question: Should one take a cautious approach to AI use in their careers, or should they embrace the opportunity to pioneer new models?
